

# *Experience feedback on Fugaku supercomputer*

Serhiy Mochalskyy, Roman Hatzky

## **IFERC Annual Workshop on GPUs #2**

June 14<sup>th</sup>, 2021

High Level Support Team

Max-Planck-Institut für Plasmaphysik

Boltzmannstr. 2, D-85748 Garching, Germany

# Fugaku supercomputer

The **Fugaku supercomputer** is the **number one** system on the **Top500** list at the RIKEN Center for Computational Science in Kobe, Japan.

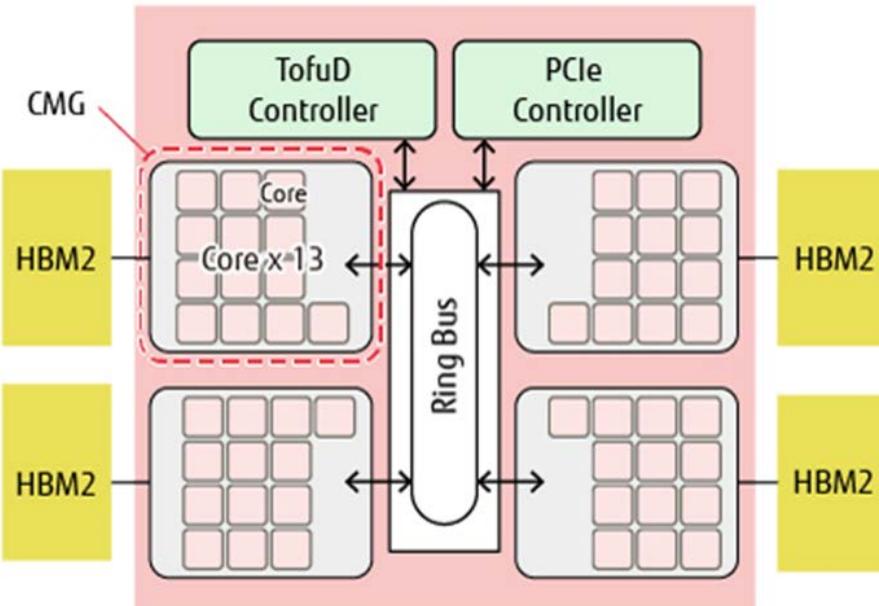

- Launched in **June 2020**.
- Production phase **2021**.
  
- Theoretical peak performance **537 PFLOPS**.
- **442 PFLOPS** in the High Performance Linpack.

# Fugaku node architecture

## Fujitsu A64FX

## Marconi SKL vs Fugaku A64FX

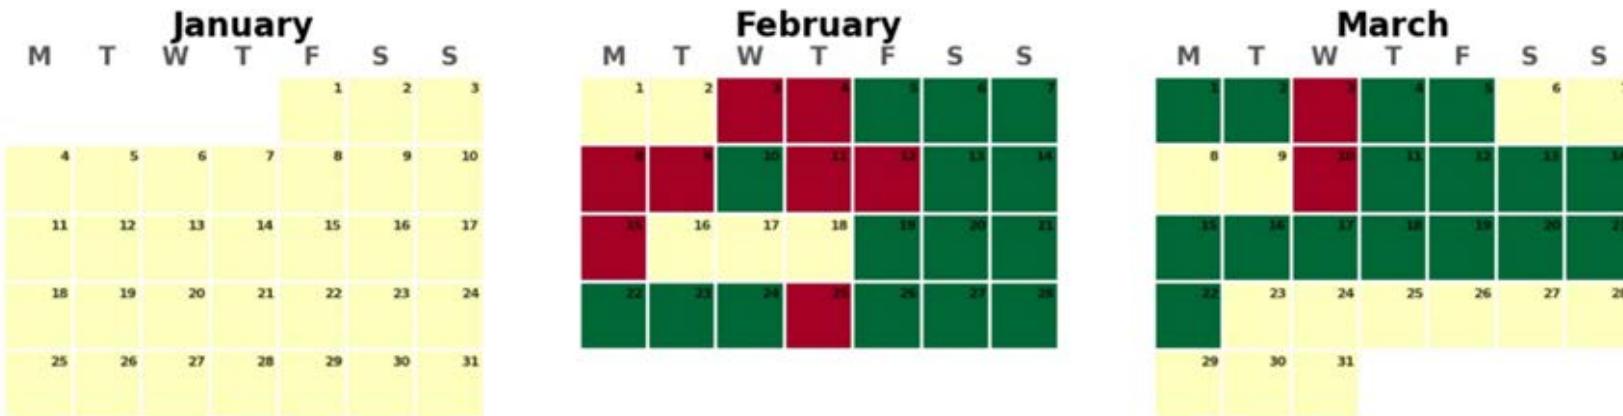

Name	Marconi SKL	Fugaku
Processor name	Intel Xeon Platinum 8160	Fujitsu A64FX
Base CPU frequency (GHz)	2.1	2.0
Number of cores per node	48	48
Number of sockets per node	2	4
Peak performance per node (GFLOPS)	3225	3072
Interconnect	OPA	TofuD
Inter-node uni-directional bandwidth (GB/s)	12.5	$6.8 * 6 = 40.8$
Intra-node uni-directional bandwidth (GB/s)	not available	256
Main memory capacity (GB)	192	32
Main memory bandwidth (GB/s)	255.94	1024

- Similar performance (~3 TFLOPS) and number of compute cores (48).
- Different node architecture (2 vs 4 sockets).
- Different memory bandwidth (1024 vs 255 GB/s). and capacity (32-5 vs 192-5 GB).
- Different inter and intra node networks.

# Fugaku supercomputer operation stability

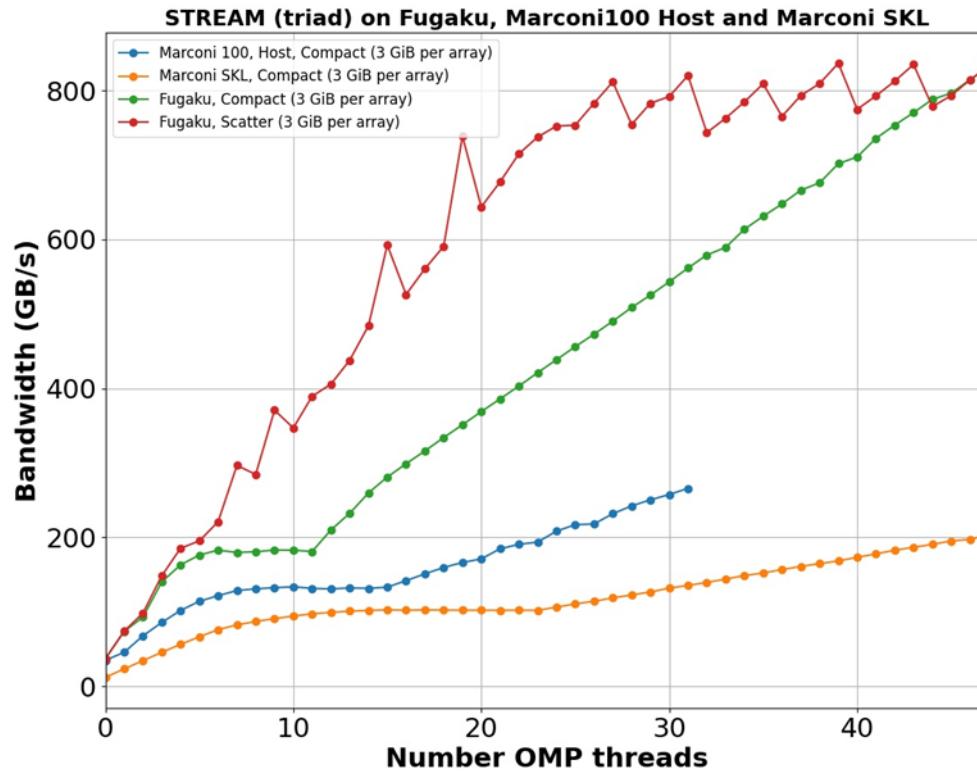

The procedure for opening an account and gaining access to the Fugaku supercomputer was relatively complicated and **took more than six weeks**. Access was granted on 12.01.2021.

- Maintenance or large scale job execution (all nodes)
- Issues and compute nodes unavailability
- Regular operation

- **Different problems appeared regularly during the whole project lifetime, which lasted until 31.03.2021.**

# STREAM on a single node

- **Marconi SKL:** **203 GB/s** from **255.94 GB/s theoretical (80 %)**.
- **Marconi100:** **266 GB/s** from **280 GB/s theoretical (95 %)**.
- **Fugaku:** **831 GB/s** from **1024 GB/s theoretical (81 %)**, with not default parameters.

The benchmark solves a dense (real\*8) system of linear equations ( $Ax=b$ ), measures the amount of time it takes to factor and solve the system, converts that time into a performance rate.

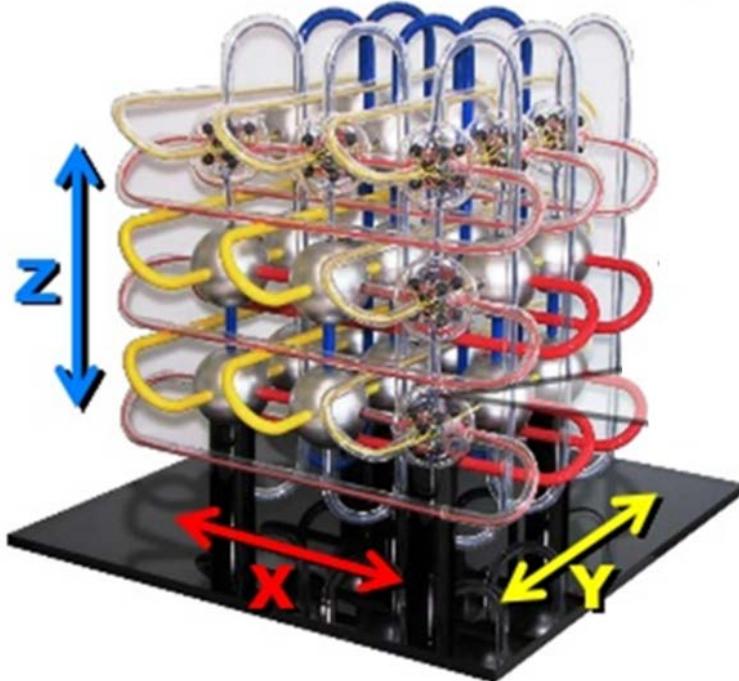

Marconi = **2.171 TFLOPS** (theoretical peak 3.225 TFLOPS ~**67 %**)

Fugaku = **1.869 TFLOPS** (theoretical peak 3072 TFLOPS ~**61 %**)

Fugaku, from support team = **2.152 TFLOPS (70 %)**

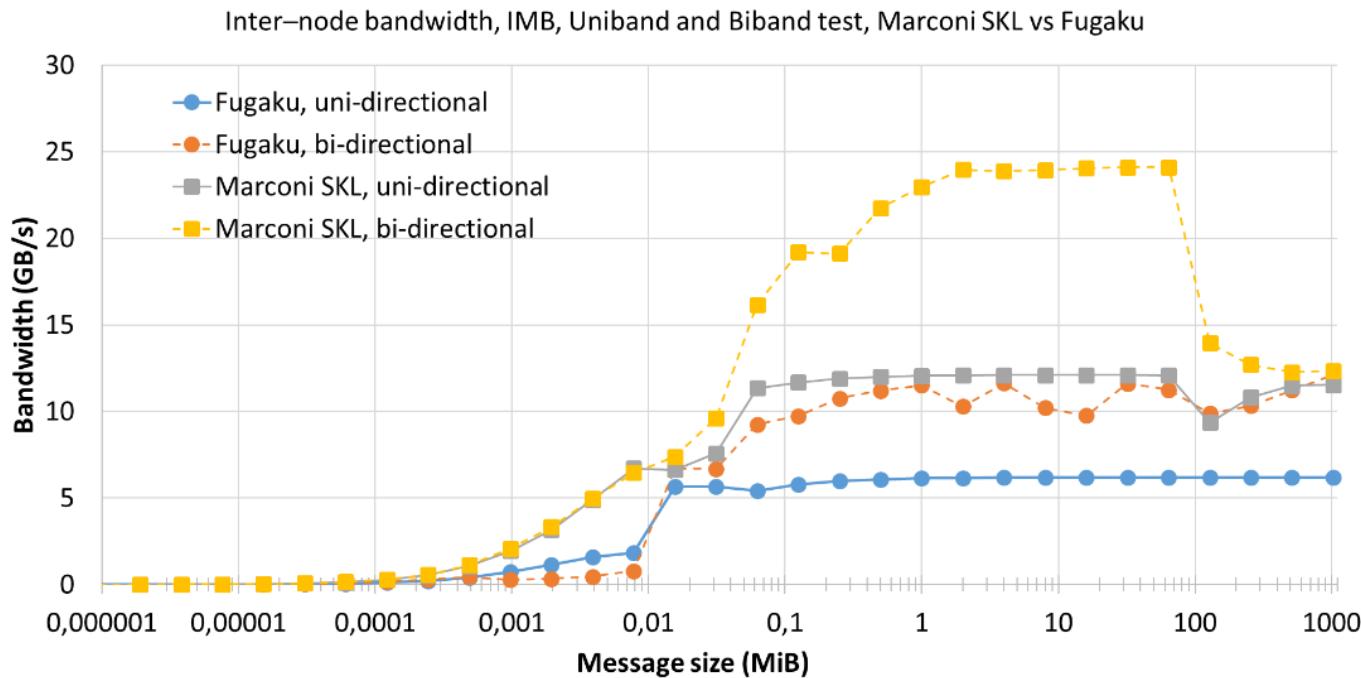

Fugaku in Top500 = **82 %** of theoretical peak

## Fujitsu TofuD interconnect

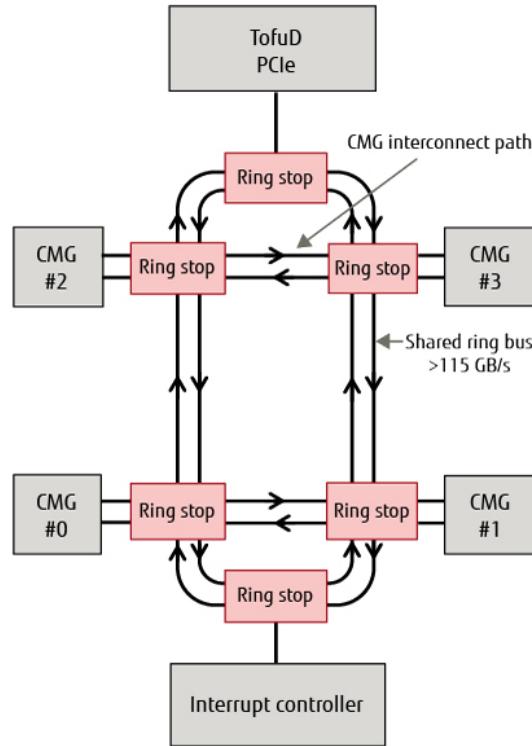

- Simultaneous data transfer in 6 directions
  - 6 Tofu network interfaces (TNI)
  - Peak memory bandwidth of **6.8 GB/s** per TNI.
- 
- Theoretical bandwidth of **40.8 GB/s** (six TNI • 6.8 GB/s) can be achieved if a node communicates with six neighboring nodes.

# Fugaku inter-node network

- A maximum *uni-directional* bandwidth of **6.2 GB/s (91.2 %)** and **12.1 GB/s (96.8 %)** reached on Fugaku and Marconi SKL using one TNI.
- A maximum *bi-directional* bandwidth of **12.1 GB/s (89 %)** and **24.1 GB/s (96.4 %)** reached on Fugaku and Marconi SKL using one TNI.
- Total uni-directional bandwidth on Fugaku using 6 TNI increases up to **38.1 GB/s** (results of Fugaku support team).

# Fugaku intra-node network

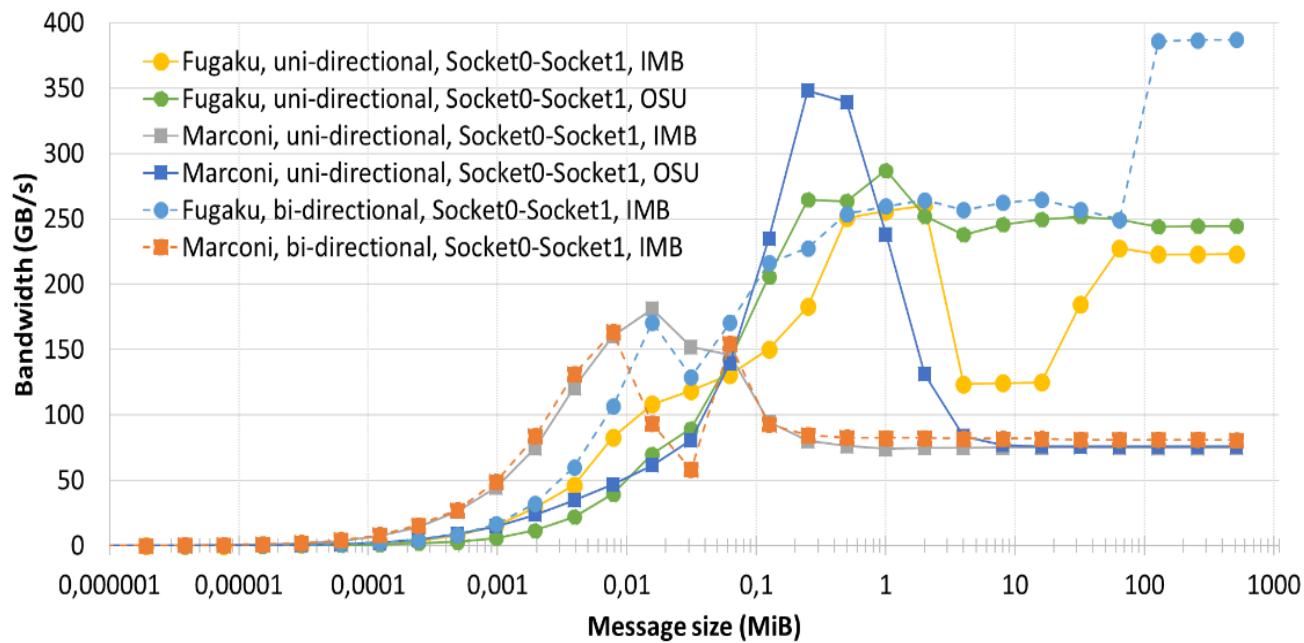

- Connection between 4 sockets (CMG)
- Two ring bus network

- Theoretical **uni-directional bandwidth of 128 GB/s (one ring) \* 2 = 256 GB/s (512 GB/s of bi-directional bandwidth).**

# Fugaku intra-node network

Inter-socket bandwidth, IMB and OSU benchmarks, Marconi SKL vs Fugaku

- Fugaku *uni-directional bandwidth*: 223–244 GB/s (87.1–95.3 %).
- Marconi *uni-directional bandwidth*: 75 GB/s.
- Marconi *bi-directional bandwidth*: 81 GB/s.
- Fugaku *bi-directional bandwidth*: 386 GB/s (75.4 %).

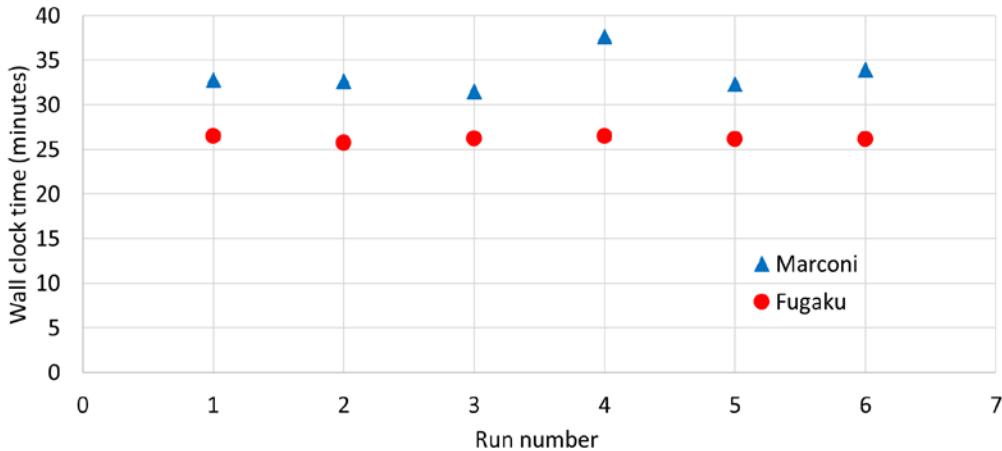

# Fugaku real code performance (1)

## ONIX code

### real execution time

ONIX code, 96 nodes, 4608 MPI tasks

### profiling

Subroutine name	Fugaku (sec)	Marconi (sec)	Speed-up (Fugaku/Marconi)
reset_variables	3,26564161	13,04882455	0,250
